Lab 4: VibeCoding — Chat History

SRN: PES2UG24CS418 | Repository: VINYAS10/45_snake

Purpose: Transcript of the ChatGPT interaction used to complete the Snake game VibeCoding assignment.

User

Help me step by step completely to complete my assignment. Don't dump everything at once; step by step we will complete. Repository: https://github.com/SETAPESU26/45_snake. SRN: PES2UG24CS418.

Assistant

We proceeded one step at a time: checked Git installation, entered the existing 45_snake folder, confirmed the project files, ran the original game, recorded the before video, inspected README/code, and then implemented the four requested assignment tasks.

User

```
git version 2.51.0.windows.1
```

Assistant

Confirmed Git was installed and moved to cloning/checking the existing repository.

User

```
The repository folder already existed; Git reported: fatal: destination path '45_snake' already exists and is not an em
```

Assistant

Explained that the repository was already present and instructed the user to enter 45_snake and list its files.

User

The directory contained game, main.py, README.md, and requirements.txt.

Assistant

Confirmed the correct project folder and instructed the user to run the original game with python main.py.

User

```
python main.py produced a pygame warning, pygame 2.6.1, and Game over! Final score: 0.
```

Assistant

Clarified that the warning was not a fatal error and asked whether the game window appeared.

User

C — the game window appeared and I recorded the original video.

Assistant

Confirmed the before video was complete and instructed the user to open the project in VS Code and inspect README.md and the game files.

User

README opened; then game_engine.py, snake.py, and food.py were opened.

Assistant

Inspected the original snake.py and identified that set_direction() allowed direct reversal into the segment behind the head.

User

Asked to use the assistant itself as the Vibe Coding tool and to provide complete runnable code from the full project files.

Assistant

Agreed. Asked for main.py, game/game_engine.py, game/snake.py, and game/food.py one at a time.

User

Provided the complete original main.py, game_engine.py, snake.py, and food.py source code.

Assistant

Provided a complete replacement snake.py implementing fair direction changes, including ignoring exact opposite directions.

User

Asked for the next file.

Assistant

Provided a complete replacement game/game_engine.py implementing collision handling, Game Over screen, replay, Easy/Medium/Hard difficulty, and generated sound feedback.

User

Replaced game_engine.py and asked for the next file.

Assistant

Provided a complete replacement food.py that selects food from available grid cells and avoids the snake.

User

Asked for the next file.

Assistant

Provided a complete replacement main.py and instructed the user to save it.

User

Confirmed main.py was replaced.

Assistant

Instructed the user to run python -m py_compile main.py game\game_engine.py game\snake.py game\food.py to check syntax without launching the game.

User

The py_compile command completed with no output/errors.

Assistant

Confirmed the syntax check passed and instructed the user to run python main.py and test the new features.

User

The modified game worked very well.

Assistant

Instructed the user to record the approximately 10-second after-change video showing the new functionality.

User

Confirmed the after video was done.

Assistant

Instructed the user to check git status before committing.

User

```
git status showed modified main.py, game/game_engine.py, game/snake.py, game/food.py and generated __pycache__ files.
```

Assistant

Explained that __pycache__ should not be submitted and instructed the user to remove generated cache files, then restore any tracked cache deletions.

User

```
git status then showed only the four modified Python files after restoring the tracked cache directory.
```

Assistant

Instructed the user to stage the four assignment files.

User

The four files were successfully staged.

Assistant

Instructed the user to commit with: git commit -m "Complete Snake game assignment".

User

Commit succeeded: [main b07d29f] Complete Snake game assignment; 4 files changed.

Assistant

Instructed the user to push, which initially failed because SETAPESU26/45_snake was not writable by VINYAS10.

User

```
git push origin main returned: Permission to SETAPESU26/45_snake.git denied to VINYAS10; HTTP 403.
```

Assistant

Explained the permission issue and instructed the user to fork the repository into the VINYAS10 account.

User

Confirmed the repository was forked.

Assistant

Instructed the user to change origin to https://github.com/VINYAS10/45_snake.git and verify it with git remote -v.

User

```
git remote -v showed origin pointing to VINYAS10/45_snake.git for fetch and push.
```

Assistant

Instructed the user to push with git push -u origin main.

User

Push succeeded: main -> main; branch main set up to track origin/main.

Assistant

Confirmed the completed code was on the user's fork and asked the user to verify the GitHub repository.

User

Uploaded a screenshot showing VINYAS10/45_snake, forked from SETAPESU26/45_snake, with the Complete Snake game assignment commit and the project files.

Assistant

Confirmed GitHub verification: the fork was one commit ahead of the original, with commit b07d29f and the four modified Python files.

User

Said they did not know whether the college wanted DOC or PDF for chat history.

Assistant

Recommended PDF because either format is acceptable and proposed preparing a clean transcript for submission.
